## INTRODUCTION

Disease specific (e.g., Chronic Heart Failure Questionnaire, Chronic Respiratory Questionnaire) and generic (e.g., EQ-5D-5L, SF-36) health measures have been increasingly used to measure the health status of populations.<sup>1,2,3,4</sup> For individuals with co-morbid chronic conditions, generic health measures have been used to measure health-related quality of life (HRQL).<sup>1,2,3</sup> However, HRQL is influenced by multiple patient<sup>5</sup> and disease factors,<sup>6</sup> and for evaluations to be informative, measures need to be representative of the population for whom the health intervention is being developed or tested.

A common generic measure used in population health assessments is the EuroQol Group's EQ-5D™, a standardized instrument used as a measure of health outcome.<sup>7</sup> The EQ-5D describes the health status of individuals using five dimensions [mobility (MO), self-care (SC), usual activities (UA), pain/discomfort (PD), and anxiety/depression (AD)]. The EQ-5D also utilizes a visual analogue scale (EQ VAS). The EQ VAS records the respondent's self-rated health on a vertical, visual analogue scale, ranging from 0 to 100, where the endpoints are labeled 'worst imaginable health state' and 'best imaginable health state', respectively.

The original version of the instrument, called EQ-5D-3L, has three response categories: no problems, some or moderate problems, and extreme problems, resulting in 243 possible unique health states. There is evidence that the EQ-5D-3L discriminates well between demographic characteristics (age, gender, income, education and various disease-specific variables), but may lack sensitivity or fail to capture important aspects of health in certain disease areas.<sup>8</sup> The EQ-5D-3L is also noted to possess a distinct upper limit for potential responses and a large proportion of participants score at or near this limit (ceiling effect).<sup>9</sup> Recognizing important limitations associated with the EQ-5D-3L, the EuroQol group introduced a five-level version, the EQ-5D-5L. The EQ-5D-5L has the same five dimensions as in the previous three level version but differs in that there are five levels of response (no problems, slight problems, moderate problems, severe problems, extreme problems), resulting in 3125 unique health states. Studies have shown that the new five-level classifier system reduces the ceiling effect and improves the measurement properties.<sup>9</sup> The EQ-5D-5L has shown to have a greater ability to discriminate among different levels of health in cancer patients,<sup>10</sup> and is more useful for describing mild health problems and monitoring population health.<sup>9</sup>

A key aspect of the EQ-5D-5L is the availability of 'value sets' to weight the EQ-5D-5L health states by local patient and population preferences, to calculate EQ-Index scores.<sup>8</sup> These 'value sets' reflect the preferences of the general public in each country, and the resulting EQ-Index score can be used to estimate quality-adjusted life years (QALYs) in economic evaluations of health interventions or innovations. With the introduction of the EQ-5D-5L, the EuroQol Group has invested considerable effort to generate country-specific values sets. Population norms for the EQ-5D-5L exist for some countries.<sup>11</sup> Currently, a Canadian research team is developing a value set for Canada, including preferences for Alberta's general population.<sup>12</sup>

The Health Quality Council of Alberta (HQCA) recently published *Alberta Provincial Norms for the EQ-5D-3L* which reported the EQ-5D-3L profile and index scores for adult males and females in Alberta.<sup>13</sup> This report, *Alberta Provincial Norms for the EQ-5D-5L*, is another contribution to the ongoing effort to document baseline values that can then be used to monitor variations in health using the new 5L tool,

and for describing the health profiles and self-reported health status of the Alberta population, stratified by male, female, and Alberta Health Services (AHS) zones (see Appendix A – Map of AHS zones).

## RESEARCH DESIGN AND METHODS

### Questionnaire

The HQCA incorporated the EQ-5D-5L in its *2014 Satisfaction and Experience with Healthcare Services* survey.<sup>14</sup> The Population Research Laboratory (PRL) at the University of Alberta reviewed the questionnaire and conducted a pre-test on routing patterns, question wording and flow, adequacy of transitional statements, instructions to interviewers and estimated the length of the interview.<sup>14</sup>

### Sampling design

Sampling quotas were drawn from the AHS zones.<sup>14</sup> The sampling quotas are representative of the age and gender composition of each AHS zone and were based on 2013 estimates of the population in each AHS zone provided by the Ministry of Health. Random digit dialing (RDD) was used to ensure that each household had an equal chance of being contacted to participate in the survey. The sampling frame was based on landlines and excluded businesses, unlisted cell phone exchanges and government exchanges. The target population consisted of people who at the time of survey were living in any of the AHS zones (South, Calgary, Central, Edmonton, and North) and could be contacted by direct dialing.<sup>14</sup>

The general rule for participation was random selection of an eligible individual who was 18 years of age or older and resided within a dialed household. In households containing more than one eligible respondent, the person with the next birthday was selected for the survey and if he/she refused, no other individual in the household was screened to participate.<sup>14</sup>

Sampling was adjusted to take into consideration the population size of each AHS zone. Analyses in this report is based on the combined sample from individual AHS zones (N=4,424). Sample weights were applied to correct for over- and under- sampling of the respective AHS zones in order to represent the total Alberta population.<sup>14</sup>

### Data collection

A computer-assisted telephone interview (CATI) system was used to allocate telephone numbers to interviewing stations. Data collection occurred in centralized CATI facilities from February to April 2014.<sup>14</sup> Interviewers received training on the CATI system and pretested the survey questionnaire prior to data collection. Survey text, questions, and instructions were presented on the computer screen to the interviewer. Interviews were conducted from 9:00 a.m. to 2:30 p.m. and 4:00 p.m. to 9:00 p.m. on weekdays, from 10:00 a.m. to 4:00 p.m. on Saturdays and from 2:00 p.m. to 8:00 p.m. on Sundays. Telephone numbers were dialed at least six times or until final disposition. For individuals who first refused to participate, a specially trained “refusal interviewer” attempted to convert initial refusals into an agreement to participate or called up to eight times to reach potential respondents before coding as “final refusal”.<sup>14</sup>

There were 94,849 telephone numbers attempted. Of these 44,648 were coded as no answer, busy, or answering machine. In total, the PRL successfully made contact with 13,940 phone numbers on at least one occasion and conducted 4,424 interviews. This represents a 31.7% survey response rate. An important aspect of the data collection process was to achieve the estimated quotas for each AHS zone. Therefore, several calls were made to achieve this goal, which increased the number of households deemed eligible (i.e., the denominator used for calculating response rate) and reduced the response rate.

Median survey interview duration was 34 minutes. For analytical purposes, 18 respondents (0.4% of sample) with missing data on the EQ-VAS are excluded and the retained study sample is 4,406.

## Reporting EQ-5D-5L results

Reporting EQ-5D-5L data depends on investigator preferences and/or anticipated user needs. In this study, the HQCA adopted the EuroQol recommendation for reporting EQ-5D-5L: first, presenting results from the EQ-5D-5L descriptive system as a health profile, and second, presenting results of the EQ VAS as a measure of overall self-rated health status.<sup>15</sup> A third recommendation, presenting results from the EQ-5D-5L index value, is not explored in this study because the algorithms for calculating EQ-5D-5L index scores have yet to be developed for Canada. EuroQol researchers have suggested an interim scoring system of mapping (or ‘cross-walking’) the EQ-5D-5L to the EQ-5D-3L value sets.<sup>16,17</sup> However, a limitation of this system of mapping is that the range of index values generated is restricted to the range of the respective value set. Thus, the HQCA chose to limit our EQ-5D-5L results to 5D-5L health profile and self-rated health status (EQ VAS). In the appendices, we present EQ-5D-5L results in numerous comparable formats with similar information using the *2012 Satisfaction and Experience with Healthcare Services* survey. In addition, tables and charts similar to those in the *Alberta Provincial Norms for the EQ-5D-3L* report are also presented using the 2014 data.

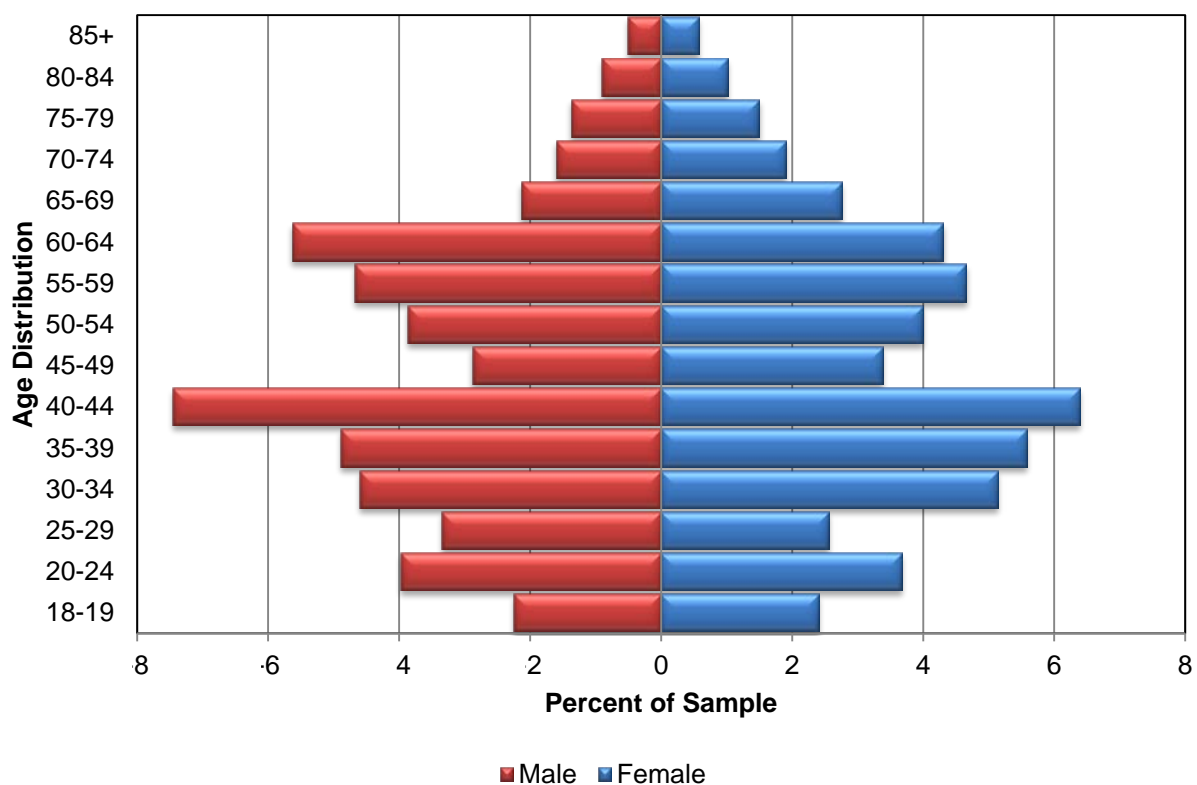

## RESULTS

### Profile of respondent sample

The mean age of the respondents was 46.1 years (standard deviation [SD] 19.7 years)

- 50.1% of the respondents were male (mean age 45.9 [SD 19.1] range 18-95 years)
- 49.9% of the respondents were female (mean age 46.3 [SD 19.9] range 18-98 years)
- The age distributions of females and males were dissimilar (Figure 1)

**Figure 1:** Age distribution of sample by sex, Alberta (2014)

## Health profile of respondents

Table 1 shows the proportion of respondents for each of the EQ-5D-5L levels within each dimension, by age group. The last column (total) presents the population average for each level within each dimension. Level 1 (no problems) is generally the most commonly reported dimension across the age groups, with the exception of the pain/discomfort dimension for respondents aged 50-59, 60-69, 70-79 and 80+ where Level 2 is most common. (See Appendix B for the percentages and corresponding confidence intervals.)

**Table 1:** Percentage of respondents by EQ-5D-5L dimension and age group, Alberta (2014)

EQ-5D-5L Dimension		AGE GROUP							TOTAL (%)
		18-29 (%)	30-39 (%)	40-49 (%)	50-59 (%)	60-69 (%)	70-79 (%)	80+ (%)	
Mobility	Level 1	90.7	85.7	82.2	71.2	62.8	55.2	50.7	77.0
	Level 2	6.8	10.1	11.2	17.9	22.7	24.4	25.5	14.3
	Level 3	2.0	2.5	4.4	7.7	9.7	13.5	13.5	5.8
	Level 4	0.3	1.2	2.0	2.6	3.5	6.5	8.4	2.3
	Level 5	0.2	0.4	0.1	0.6	1.3	0.4	1.9	0.5
Self-Care	Level 1	98.5	97.3	94.3	93.0	92.2	91.2	89.5	94.8
	Level 2	0.9	1.2	4.0	5.6	4.2	5.1	8.2	3.4
	Level 3	0.3	1.2	1.3	1.0	2.5	3.0	0.9	1.3
	Level 4	0.3	0	0.1	0	0.5	0	1.5	0.2
	Level 5	0	0.3	0.2	0.4	0.7	0.7	0.0	0.3
Usual Activities	Level 1	85.6	81.8	81.1	73.2	69.1	64.9	63.8	77.3
	Level 2	10.1	12.0	11.2	15.2	19.8	18.9	23.7	14.0
	Level 3	3.0	4.4	4.3	8.7	7.7	13.0	11.4	6.1
	Level 4	1.0	1.3	1.7	1.4	2.4	1.0	0.9	1.5
	Level 5	0.2	0.5	1.7	1.6	1.0	2.1	0.3	1.0
Pain/Discomfort	Level 1	61.8	51.1	43.8	33.8	30.3	25.1	32.6	43.3
	Level 2	27.4	31.9	36.9	39.0	41.2	46.7	41.6	35.6
	Level 3	8.4	12.0	13.2	20.0	22.0	23.6	19.6	15.4
	Level 4	1.6	3.3	4.5	5.7	4.7	3.2	4.3	3.9
	Level 5	0.9	1.8	1.6	1.6	2.0	1.4	1.8	1.6
Anxiety/Depression	Level 1	60.7	67.3	66.5	69.5	67.8	75.3	77.0	67.2
	Level 2	26.7	22.1	20.8	17.9	19.9	19.9	18.1	21.3
	Level 3	9.0	8.8	8.6	10.0	9.6	3.9	4.8	8.9
	Level 4	2.3	1.5	2.2	1.9	1.8	0.1	0.3	1.8
	Level 5	1.3	0.4	1.8	0.7	0.8	0.9	0	1.0

Note: **Level 1** (no problem), **Level 2** (slight problem), **Level 3** (moderate problem), **Level 4** (severe problem), **Level 5** (extreme problem)

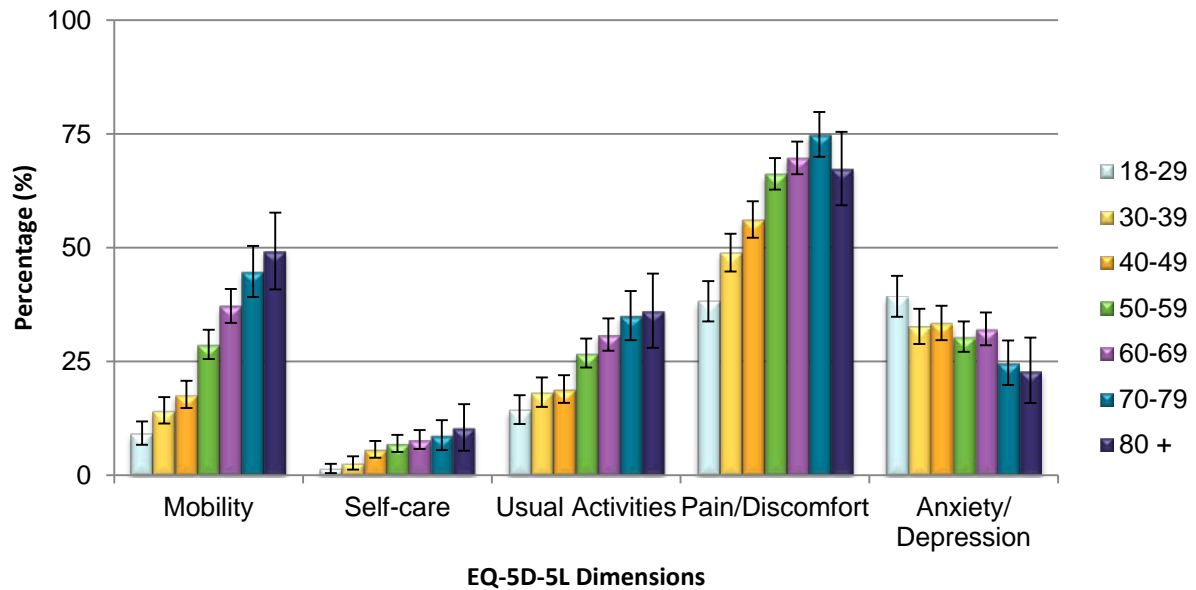

Table 2 illustrates the count of respondents who reported ‘no problems’ (Level 1) compared to those who reported ‘problems’ (levels 2 to 5) by age group. Of all the dimensions, respondents reported problems with pain/discomfort most frequently. In contrast, the least reported problems were in the self-care dimension.

**Table 2:** Counts of respondents reporting no problems versus problems by EQ-5D-5L dimension and age group, Alberta (2014)

EQ-5D-5L Dimension		AGE GROUP							TOTAL
		18-29	30-39	40-49	50-59	60-69	70-79	80 +	
Mobility	No problems	730	767	727	542	411	156	68	3,401
	Problems	75	128	157	219	244	127	66	1,016
Self-Care	No problems	794	869	839	708	606	258	119	4,193
	Problems	12	24	51	53	52	25	14	231
Usual Activities	No problems	690	729	721	556	454	183	85	3,418
	Problems	116	163	169	204	203	99	48	1,002
Pain/Discomfort	No problems	498	455	390	257	199	71	43	1,913
	Problems	308	436	500	503	458	212	90	2,507
Anxiety/Depression	No Problems	488	599	589	529	442	211	102	2,960
	Problems	316	291	296	232	210	69	31	1,445

Figure 2 and 3 show the percentage of respondents who reported problems (Levels 2 to 5) for each of the EQ-5D-5L dimensions, by age group. Except for anxiety/depression, people reported more problems for the other four dimensions (mobility, self-care, usual activities, pain/discomfort) as they aged (see Appendix C for more details). Males and females had similar patterns in reporting problems across all five dimensions (see Appendix D for more details).

**Figure 2:** Percentage of respondents reporting problems by EQ-5D-5L dimension and age, Alberta (2014)

**Figure 3:** Percentage of respondents reporting problems by EQ-5D-5L dimension and age, Alberta (2014)

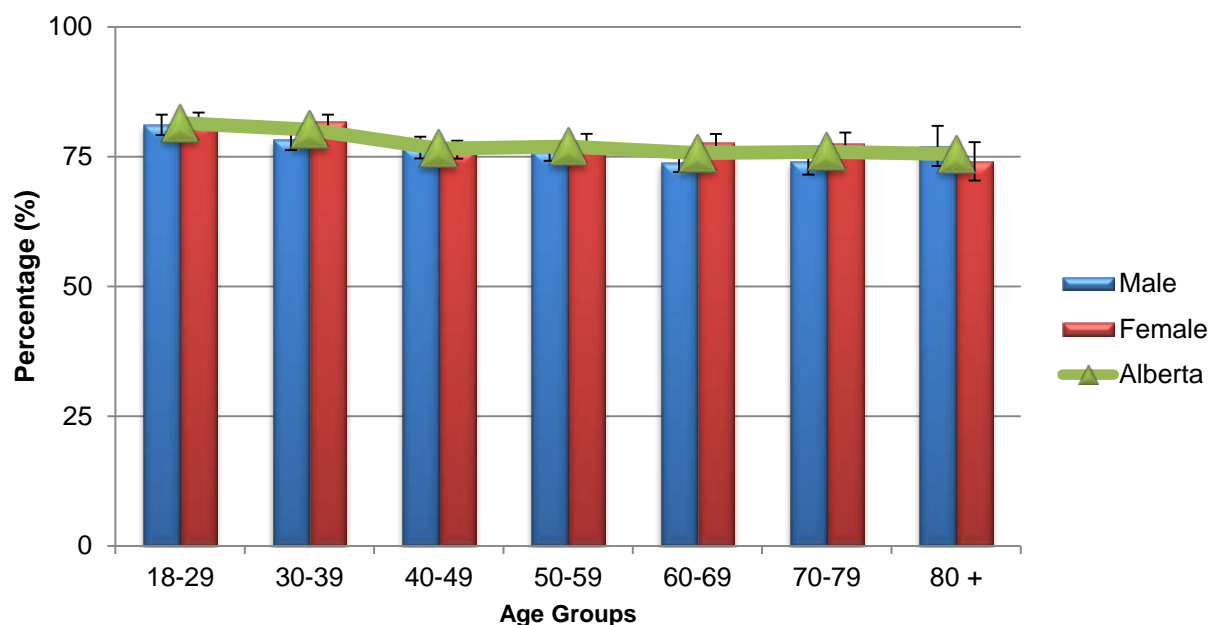

## Overall self-rated health status by age group

The EQ-5D-5L self-reported VAS data generates information on the overall health-related quality of life of respondents. In Alberta, the mean EQ VAS ratings decreased with increasing age (Table 3)(see Appendix E for more details). The mean EQ VAS rating reported by males compared to females was similar within each age group (Figure 4). (see Appendix E for more details).

**Table 3:** EQ VAS, mean, standard deviation, median, percentiles by age, Alberta (2014)

EQ VAS	AGE GROUPS							TOTAL
	18-29	30-39	40-49	50-59	60-69	70-79	80 +	
Mean	81	80	77	77	76	76	76	<b>78</b>
Std Dev	14	14	17	17	16	15	16	<b>16</b>
Median	85	85	80	80	70	80	80	<b>80</b>
25th	75	75	70	70	70	70	70	<b>72</b>
75th	90	90	90	90	85	87	85	<b>90</b>

**Figure 4:** Mean population EQ-VAS ratings by age/sex, Alberta (2014)

## Overall self-rated health status by AHS zone

Table 4 shows the proportion of respondents for each of the EQ-5D-5L Levels within each dimension, by AHS zone. Level 1 (no problems) is the most commonly reported dimension across the AHS zones, and across the dimensions. (See Appendix F for the percentages and corresponding confidence intervals.)

**Table 4:** Percentage of respondents by EQ-5D-5L dimension and AHS Zone, Alberta (2014)

<b>Mobility</b>	<b>South (%)</b>	<b>CAL (%)</b>	<b>Central (%)</b>	<b>EDM (%)</b>	<b>North (%)</b>
Level 1	74	79	73	78	75
Level 2	14	13	17	13	17
Level 3	9	5	7	6	6
Level 4	3	2	3	3	2
Level 5	1	1	0	1	0
<b>Self-care</b>					
Level 1	93	95	96	95	95
Level 2	5	4	2	3	3
Level 3	2	1	1	1	1
Level 4	1		0	0	0
Level 5	0	1	0	0	0
<b>Usual Activities</b>					
Level 1	74	78	76	79	75
Level 2	15	14	14	13	15
Level 3	9	6	6	5	8
Level 4	2	1	2	2	2
Level 5	1	1	1	1	1
<b>Pain/Discomfort</b>					
Level 1	37	47	42	40	39
Level 2	38	36	34	33	37
Level 3	17	12	18	14	19
Level 4	5	4	4	3	4
Level 5	3	1	1	1	1
<b>Anxiety/Depression</b>					
Level 1	68	68	69	65	65
Level 2	20	21	21	22	23
Level 3	8	8	8	10	9
Level 4	2	1	2	3	2
Level 5	2	1	0	1	1

Note: **Level 1** (no problem), **Level 2** (slight problem), **Level 3** (moderate problem), **Level 4** (severe problem), **Level 5** (extreme problem)

Table 5 illustrates the count of respondents who reported ‘no problems’ (Level 1) compared to those who reported ‘problems’ (Levels 2 to 5) by AHS zone. Of all the dimensions, the most number of respondents, among the five AHS zones, to report problems were in the pain/discomfort dimension, and this was the only dimension where the number of respondents reporting problems was greater than those reporting no problems. In contrast, the least number of respondents to report problems, amongst the five AHS zones, were in the self-care dimension.

**Table 5:** Counts of reported of respondents reporting no problems versus problems by EQ-5D-5L dimension and AHS zone, (2014)

EQ-5D-5L Dimension		AHS Zones					TOTAL
		South	Calgary	Central	Edmonton	North	
Mobility	No Problems	582	777	593	795	602	3,349
	Problems	210	203	219	230	206	1,068
Self-Care	No Problems	738	930	779	975	769	4,191
	Problems	54	53	32	53	40	232
Usual Activities	No Problems	582	767	619	808	603	3,379
	Problems	209	216	191	218	205	1,039
Pain/Discomfort	No Problems	290	458	341	439	317	1,845
	Problems	500	524	471	587	491	2,573
Anxiety/Depression	No Problems	539	669	561	669	528	2,966
	Problems	249	308	250	355	279	1,441

## EQ VAS, mean, standard deviation, median, percentiles by AHS zone

Table 6 displays the mean EQ VAS ratings for respondents across the five AHS zones. The results are statistically similar across the zones (see Appendix G for more details).

**Table 6:** EQ VAS, mean, standard deviation, median, percentiles by AHS zone, (2014)

EQ VAS	AHS Zone					TOTAL
	South	Calgary	Central	Edmonton	North	
Mean	78	79	78	77	77	78
Std Dev	17	15	16	17	17	16
Median	80	80	80	80	80	80
25th	75	75	70	70	70	72
75th	90	90	90	90	90	90

## GOING FORWARD

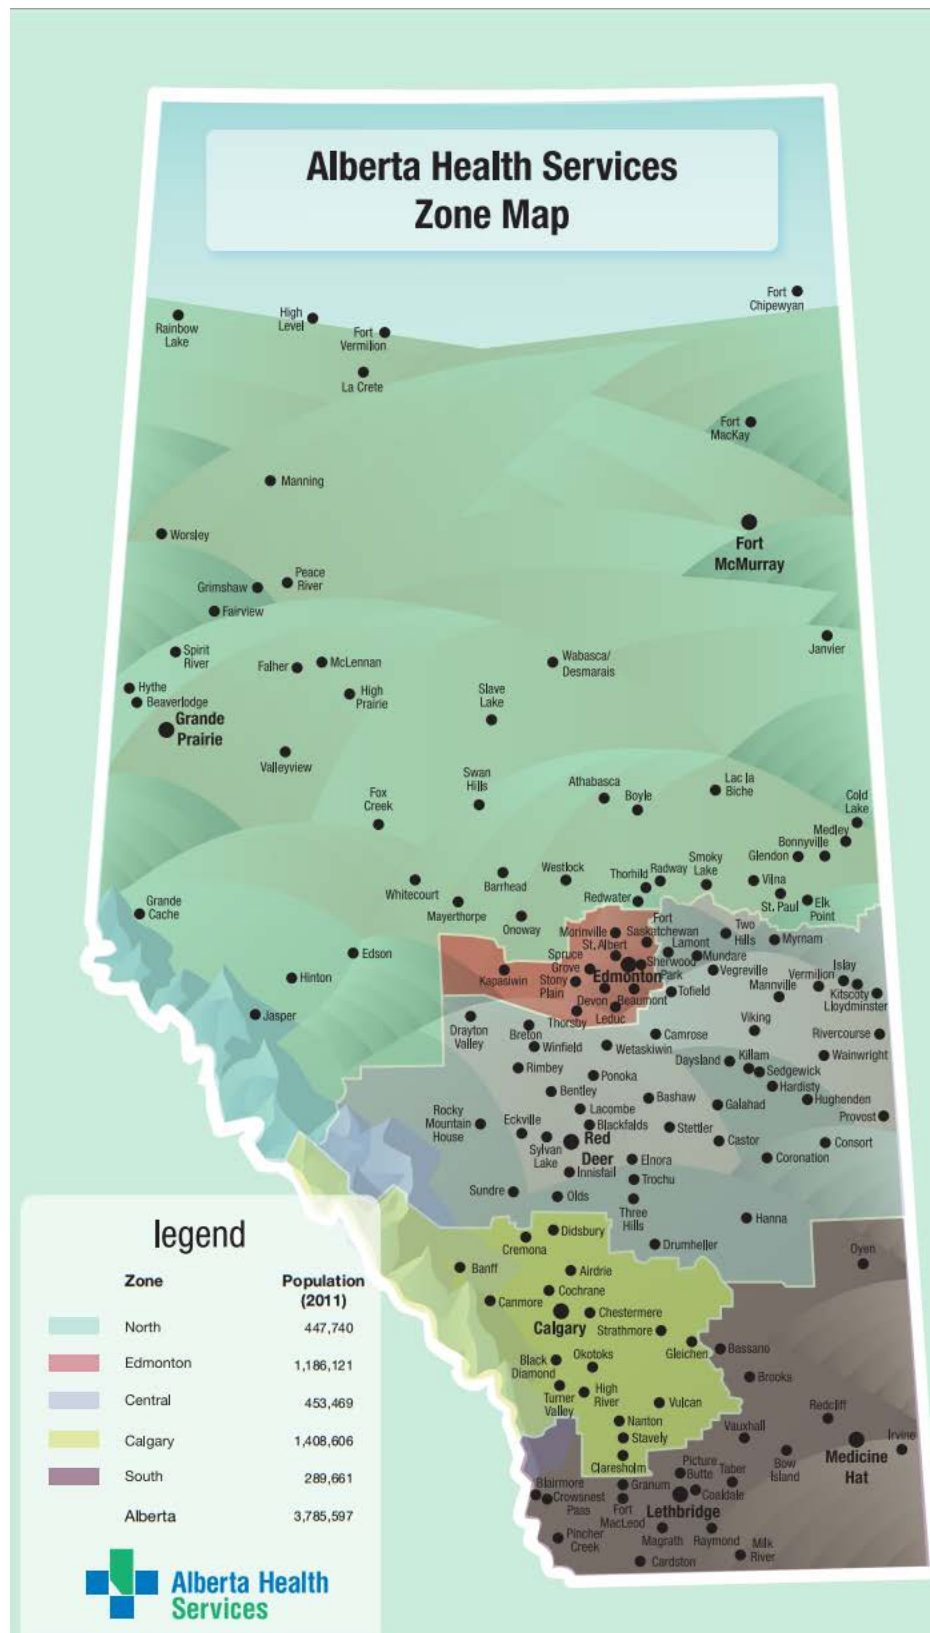

The HQCA recognized in its 2014 *Primary Healthcare Measurement Initiative Report*,<sup>18</sup> that the systematic measurement of primary healthcare quality begins by measuring its impact on health – restoration or maintenance of functional health. Routinely capturing disease-specific and generic health outcome measures makes it possible for performance to be tracked and compared for both similar and diverse healthcare interventions. The benefits of a generic health outcomes measure go beyond primary healthcare to encompass the entire healthcare system; anywhere there is a need to measure health outcomes. At the front line, health outcome measures can be valuable in the overall assessment of the patient, and may increase the detection of functional problems; improving the care physicians and healthcare teams give their patients.<sup>19</sup> At a clinical and program level, this information can be used for the evaluation of innovations in healthcare delivery and performance. At a system level, measurement of healthcare quality and health outcomes is essential to determining health service quality and value received for public expenditure on services.

The EQ-5D-5L is increasingly being used to inform health policy and decision-making.<sup>20,21</sup> It is designed to describe differing health states as they apply to individuals based on five health dimensions and five self-reported levels of impairment/problems. Additionally, its usefulness stems from it being relatively brief (taking only a few minutes to complete), easy to ‘add-on’ to existing survey instruments, capable of producing a single index which can be used to summarize health status, and also be used to calculate quality-adjusted life years (QALYs).<sup>22</sup> Although it may be less responsive to changes in specific conditions than disease-specific instruments (e.g., Chronic Heart Failure Questionnaire, Chronic Respiratory Questionnaire),<sup>8</sup> the EQ-5D-5L is useful for broad comparisons of the relative impact of different conditions or treatments on the health of the population. It is for this reason that the HQCA produced this report; it provides baseline values that can then be used to monitor variations in self-reported health status, and for describing the health profiles and self-reported health status of the Alberta population.

## APPENDICES

## APPENDIX A – MAP OF AHS ZONES

## APPENDIX B

**Table 7:** Percentage of 18 to 29 year old respondents, with 95% confidence intervals, by EQ-5D-5L dimension, Alberta (2014)
